

Vibing Steampunk (vsp) - App Summary

What It Is

Vibing Steampunk (vsp) is a Go-based MCP server that bridges AI assistants to SAP ADT APIs, enabling AI-agentic ABAP development across ECC and S/4HANA systems.

Who It's For

ABAP developers and teams using AI assistants (for example, Claude) to work with SAP systems through ADT.

What It Does

- Exposes focused and expert MCP tool sets for ABAP read/write/search/test operations.
- Provides AI debugger workflows: breakpoints, attach/listen, step, and variable inspection.
- Supports RAP OData end-to-end: CDS, service definitions/bindings, and publish.
- Offers CLI mode for direct operations like search, source, and export.
- Includes DSL and YAML workflows for automation and CI/CD pipelines.
- Exports/imports in abapGit-compatible formats and deploys files directly.

How It Works

AI/MCP clients communicate with vsp over JSON-RPC via stdio. vsp registers tools and runs in focused or expert mode, then calls the pkg/adt client library (read/write/devtools/intel/workflows). The ADT client uses an HTTP layer (CSRF, sessions, auth) to call SAP ADT REST APIs, and responses flow back to the client.

How To Run

- Download the latest release binary and chmod +x it (or build via make build).
- Set SAP connection variables (SAP_URL, SAP_USER, SAP_PASSWORD, optional SAP_CLIENT) or create .vsp.json.
- Run ./vsp (MCP server) or use CLI commands like vsp search ...
